

## Testing>Registration markings

### Objectives of this task:

To fit complying registration markings to the aircraft.

You will need to determine the requirements of the aviation authority in your own country. In Australia either the Recreational Aircraft Association (RAA) for recreational registration or the Civil Aviation Safety Authority (CASA) for general aviation registration controls the allocation of aviation registration markings.

Registration markings should be made from vinyl by a specialist sign-writing company and applied by them, usually under the left wing and on each side of the empennage.

The drawings above show the RAA requirements as an example.

This completes the *Testing>Registration markings* task.
